Abstract (Basic): BE 774600 A

Catalyst for liquid phase polymn of alpha-olefins to either atactic or isotactic polymers consists of, in the case of atactic polymer, the reaction product of (I) a hydride or organometal cpd. of a group I, II or III metal, and (II) the pdt. obtained by contacting a Ti cpd. with a support consisting of anhydrous halide of Mg or Mn, or mixts. of these halies with anhydrous cpds. of groups I, II, III or IV elements, the halide being present in an active form where x-ray spectrum shows less intense, wider diffraction lines than those of the non-active anhydrous halide, and whose specific surface is >3m²/g, or, in the case of isotactic polymer, the reaction pdt. of (I) and (II) in which (II) is modified by an electron donor cpd. contg. >=1 N, O, P or S atom.

Derwent Class: A17
